BBJ 777

WORLD’S LARGEST TWINJET

When the Boeing 777 rolled out of the factory in 1994, it was hailed as the first aircraft to be completely designed, instead of being modular. Inside and out, Boeing engineers and designers used three-dimensional computer graphics to present the airplane visually. The 777 is the largest jetliner in the world and one of the most fuel-efficient aircraft in service.

Boeing Business Jets has received new orders for BBJ variants of the 777, which will be tailored on the 777-200ER, long range, and 777-300ER Extended Range. The 777-300ER, the world’s longest range commercial aircraft, can fly nonstop to 3,000 miles, the longest commercial passenger airliner flight, covering 11,080 kilometers between Hong Kong and London. The 777-300ER is the most popular 777 commercial model, currently with 800 orders on the books.

Both 777 models lend themselves beautifully to use as VIP transports, providing owners and operators with large, comfortable spaces.
